

Part A: DATA JOIN

Step 1: Connect Customer.xlsx

1. Open Tableau Desktop.
2. From the Connect section, select Microsoft Excel.
3. Select the Customer.xlsx file.
4. Click Open.
5. The Customer sheet will appear on the Data Source page.

Screenshot 1: Customer.xlsx connected in Tableau.

Step 2: Add Customer Order.xlsx

1. On the Data Source page, click Add under Connections.
2. Select Microsoft Excel.
3. Open Customer Order.xlsx.
4. Drag the Customer Order table beside the Customer table.

Screenshot 2: Customer and Customer Order tables visible.

Step 3: Create a Full Outer Join

1. Click the join area between Customer and Customer Order.
2. Select the common field:
 - Customer.Customer ID ○
 - Customer Order.Customer ID
3. Select Full Outer Join.

Join condition:

Customer.Customer ID = Customer Order.Customer ID

A Full Outer Join is used to preserve matching and unmatched records from both tables.

Screenshot 3: Full Outer Join between Customer and Customer Order.

Step 4: Add Product.xlsx

1. Add another Excel connection.
2. Select Product.xlsx.
3. Add the Product table to the data model.
4. Join Product with Customer Order.

Use:

Customer Order.Product ID = Product.Product ID

5. Select Full Outer Join.

Screenshot 4: Full Outer Join between Customer Order and Product.

Step 5: Create the Join Output

Go to Sheet 1.

Drag the following fields into the view:

- Customer ID
- Order ID
- Product ID
- Product Name

The final table should display:

Screenshot 5: Final Join output showing all four fields.

Customer ID	Order ID	Product ID	Product Name
Customer01	OH101134	PD202011	Story Bookcase
Customer02	OH101135	PD202012	Rotating Chair
Customer03	OH101136	PD202013	Name Labels
Customer03	OH101137	PD202014	Laptop Tables
Customer03	OH101138	PD202015	File Storage
Customer03	OH101139	PD202016	Kitchen Farmington
Customer04	OH101140	PD202017	Fine Art
Customer04	OH101141	PD202018	Smart Phone
Customer04	OH101142	PD202019	Binders
Customer04	OH101143	PD202020	Home Appliances

Part B: DATA BLENDING

Step 1: Select Customer Order as Primary Data Source

For Data Blending, use Customer Order as the Primary Data Source because it contains both Customer ID and Product ID.

1. Select the Customer Order data source.
2. Drag Customer ID to the Rows shelf.
3. Drag Order ID to the Rows shelf.

The first data source used in the worksheet becomes the primary data source.

Screenshot 1: Customer Order selected as the Primary Data Source.

Screenshot 3: Product ID linking field.

From the Product data source:

1. Drag Product ID to the Rows shelf.

Screenshot 4: Product ID added to the worksheet.

From the Product data source:

1. Drag Product Name to the Rows shelf.

The final view should contain:

Customer ID | Order ID | Product ID | Product Name

Screenshot 5: Final Data Blend output.

Tableau Desktop interface showing a data blend of three tables: Customer, Order, and Product. The Columns shelf contains Customer ID, Order ID, and Product ID. The Rows shelf contains Product Name. The Marks shelf is set to Automatic. The view displays a table with columns: Customer ID, Order ID, Customer ID, Product ID, and Product Name. Data is grouped by Customer ID.

Customer ID	Order ID	Customer ID	Product ID	Product Name	
Customer01	0101134	Customer01	P0202011	Stony Biscuits	Abc
	0101135	Customer02	P0202012	Rotating Chair	Abc
	0101136	Customer02	P0202013	Name Labels	Abc
Customer03	0101137	Customer03	P0202014	Laptop Tables	Abc
	0101138	Customer03	P0202015	File Storage	Abc
	0101139	Customer04	P0202016	Kitchen Farmington	Abc
Customer04	0101140	Customer04	P0202017	Line Art	Abc
	0101141	Customer04	P0202018	Smart Phone	Abc
	0101142	Customer04	P0202019	Blinkers	Abc
	0101143	Customer04	P0202020	Home Appliances	Abc
