

Difference Between Groups and Sets in Tableau

Feature	Groups	Sets
Purpose	Combines similar data values into categories	Creates a subset of data based on selected members or conditions
Based on	Usually manually selected dimension members	Selection, conditions, or Top/Bottom rules
Dynamic	Generally fixed unless manually changed	Can be dynamic and update based on conditions
Example	Group cities into Mumbai, Pune, Delhi	Create a Top 10 Customers set
Common use	Simplifying and categorizing data	Comparing or analyzing a specific subset

1. Groups — Use Case

Suppose you have a City field containing:

Mumbai, Pune, Delhi, Chennai, Nagpur

You can create a group such as:

- **Maharashtra** → Mumbai, Pune, Nagpur
- **Other Cities** → Delhi, Chennai

This is useful when you want to combine similar values into meaningful categories.

2. Sets — Use Case

Suppose you have Customer and Sales data. You can create a Top 10 Customers set based on Sales.

The set automatically identifies the customers meeting the Top 10 condition and can be used to compare:

Top 10 Customers vs Other Customers

Easy way to remember

Group = Combine values into categories.

Set = Select a subset of data for analysis.
