

By Using insurance.csv file attempt the following.

1. Create donut chart for incident severity which shows percentages of policy annual premium.

Goal

Show Incident Severity categories and the percentage of total Policy Annual Premium represented by each category.

Step 1: Create a Pie Chart

1. Open insurance.xlsx in Tableau.
2. Create a new worksheet and rename it Incident Severity Donut.
3. Drag Incident Severity to Color on the Marks card.
4. Drag Policy Annual Premium to Angle.
5. Make sure it is:

SUM(Policy Annual Premium)

6. Click Show Me → Pie Chart if necessary.

Step 2: Display percentages

1. Drag Policy Annual Premium to Label.
2. Right-click the second copy of the measure.
3. Select:

Quick Table Calculation → Percent of Total

4. Format the value as a Percentage.
5. Turn on Show Mark Labels.

Step 3: Convert Pie Chart into a Donut

1. Create a calculated field
2. Create a **dual-axis** view with two pie marks.
3. Keep the first pie as your Incident Severity chart.
4. On the second pie:
 - Remove Incident Severity.
 - Make the pie smaller using **Size**.
 - Give it the background color.
5. Right-click the second axis → **Dual Axis**.

2. Create bullet graph Gender wise Capital gain , which also shows 60%,80% and average property claim.

Goal

Compare Capital Gain by Gender, while displaying:

- 60% reference
- 80% reference
- Average Property Claim

Step 1: Select the fields

In the Data pane, select:

- Gender
- Capital Gain
- Property Claim

Then click Show Me → Bullet Graph.

Tableau's bullet graph is designed to compare a primary measure with another measure/reference and can automatically create distribution bands at 60% and 80% plus an average reference line.

Step 2: Arrange the view

You want:

Gender → Rows

Capital Gain → main measure

Property Claim → comparison/reference measure

If Tableau puts the measures in the opposite roles, use Swap Reference Line Fields from the axis menu.

Step 3: Verify the reference bands

Right-click the axis → Edit Reference Line / Edit Reference Distribution.

Check that the bands are:

- 60%
- 80%

and that the reference line is:

- Average

 Screenshot: Gender-wise bullet graph showing Capital Gain, 60%, 80%, and Average Property Claim.

3. Create motion chart which displays total claim amount vs policy deductible for each auto model.

Step 1 — Open a new worksheet

At the bottom, click **New Worksheet (+)**.

Step 2 — Put Auto Model on Detail

From the **Data** pane:

Auto Model → **Marks** card → **Detail**

Do **not** put Auto Model on Rows or Columns.

Step 3 — Put Total Claim Amount on Columns

Drag:

Total Claim Amount → **Columns**

It should show:

SUM(Total Claim Amount)

Step 4 — Put Policy Deductible on Rows

Drag:

Policy Deductible → **Rows**

It should show:

SUM(Policy Deductible)

Your shelves should now look like:

Columns

SUM(Total Claim Amount)

Rows

SUM(Policy Deductible)

Marks → Detail

Auto Model

Step 5 — Change the Marks type

On the **Marks** card, click **Automatic**.

Select:

Circle

Now you should see circles representing the different Auto Models.

Step 6 — Add the time field to Pages

From your Data pane, find:

Policy Bind Date

Drag:

Policy Bind Date → Pages

This is the important part. Policy Bind Date is your **time/order field**.

Tableau should create a **Pages** card with the date.

Step 7 — Set the date level

On the **Pages** card, click the drop-down beside Policy Bind Date.

Choose:

Month

If Month gives too many/few useful steps, you can use **Year** instead.

Step 8 — Make Auto Model identifiable

On the Marks card:

Auto Model → Label

You can keep Auto Model on Detail as well.

This will display the model name on the circles.

Step 9 — Play the motion chart

On the Pages card, click the ► Play button.

The chart should now move through the different Policy Bind Date periods.

4. Compare all KPIs in the given dataset.

We will create 6 KPI cards and then combine them into one dashboard.

Part 1 — KPI 1: Total Claim Amount

Step 1

At the bottom of Tableau, click New Worksheet (+).

Step 2

Rename the sheet:

KPI - Total Claim Amount

Step 3

From the Data pane on the left, find:

Total Claim Amount

Drag it to:

Marks → Text

Step 4

Check the aggregation.

It should say:

SUM(Total Claim Amount)

If it says AVG, click the field's drop-down → Measure → Sum.

Step 5 — Format the KPI

On the Marks card:

Text → ...

You will see something similar to:

SUM(Total Claim Amount)

Select the value and increase the font size to around 24–30.

Make it Bold.

You can format it like:

TOTAL CLAIM AMOUNT

12,345,678

Step 6

You have completed your first KPI.

Part 2 — KPI 2: Total Policy Annual Premium

Part 3 — KPI 3: Average Policy Deductible

Part 4 — KPI 4: Total Capital Gain

Part 5 — KPI 5: Average Property Claim

Part 6 — KPI 6: Total Vehicle Claim

Part 7 — Check your six worksheets

Part 8 — Create the KPI Dashboard

Step 1

At the bottom, click:

New Dashboard

Step 2 — Dashboard title

Click:

Dashboard → Show Title

Double-click the title.

Enter:

Insurance Performance KPI Dashboard

Part 9 — Add the first three KPI cards

Part 10 — Add the remaining three

Part 11 — Make the cards look clean

Part 12 — Add your three assignment charts

1. Donut Chart
2. Bullet Graph
3. Motion Chart

Part 13 — What "Compare All KPIs" means

You don't need to put all six KPIs into one graph.

The purpose is to display the important metrics together in one dashboard, so they can be viewed and compared quickly.

For example:

- Total Claim Amount → overall claim value
- Total Premium → overall premium value
- Average Policy Deductible → typical deductible
- Total Capital Gain → total capital gain
- Average Property Claim → typical property claim
- Total Vehicle Claim → overall vehicle claim
